Ubuntu Linux 2
RedHat Enterprise Linux (native stack) 18
Amazon Linux AMI (native stack) 19

BitNami Cloud Hosting images come with the several BitNami components installed by default. We refer to this as the 'base stack'. This base stack is located in the **/opt/bitnami** directory and includes the components listed below. To launch a server in BitNami Cloud Hosting that includes the LAMP / Ruby / Java / Python / Node.js stack components listed below, simply launch a new server without adding any applications to it.

You can find more info about BitNami components in the following article:

- Components

Note that Red Hat and Amazon Linux images do not include BitNami components. Instead, we use the Red Hat and Amazon Linux native stacks (Apache web server, PHP, MySQL database etc.), which is taken from RedHat or Amazon Linux repositories, and install BitNami web applications on top of it. This allows you to use the operating system tools to keep the stack components up to date and enables you to maintain consistency across your environment.
